

# **Synchronization: Basics**

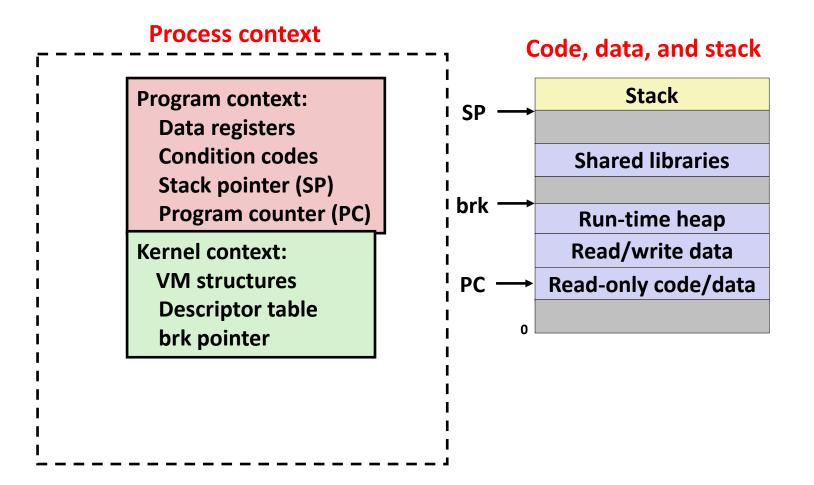

15-213: Introduction to Computer Systems 24<sup>th</sup> Lecture, April 18, 2019u

# **Today**

- **■** Threads review
- Sharing
- Mutual exclusion
- Semaphores

#### **Traditional View of a Process**

Process = process context + code, data, and stack

#### **Alternate View of a Process**

Process = thread + (code, data, and kernel context)

#### **Thread (main thread)** Code, data, and kernel context **Shared libraries** Stack brk SP Run-time heap Read/write data **Thread context:** PC Read-only code/data **Data registers Condition codes** Stack pointer (SP) **Program counter (PC) Kernel context:** VM structures **Descriptor table** brk pointer

# **A Process With Multiple Threads**

- Multiple threads can be associated with a process
  - Each thread has its own logical control flow
  - Each thread shares the same code, data, and kernel context
  - Each thread has its own stack for local variables
    - but not protected from other threads
  - Each thread has its own thread id (TID)

#### Thread 1 (main thread) Thread 2 (peer thread)

#### stack 1

Thread 1 context:

Data registers

Condition codes

SP<sub>1</sub>

PC<sub>1</sub>

#### stack 2

Thread 2 context:

Data registers

Condition codes

SP<sub>2</sub>

PC<sub>2</sub>

#### Shared code and data

#### shared libraries

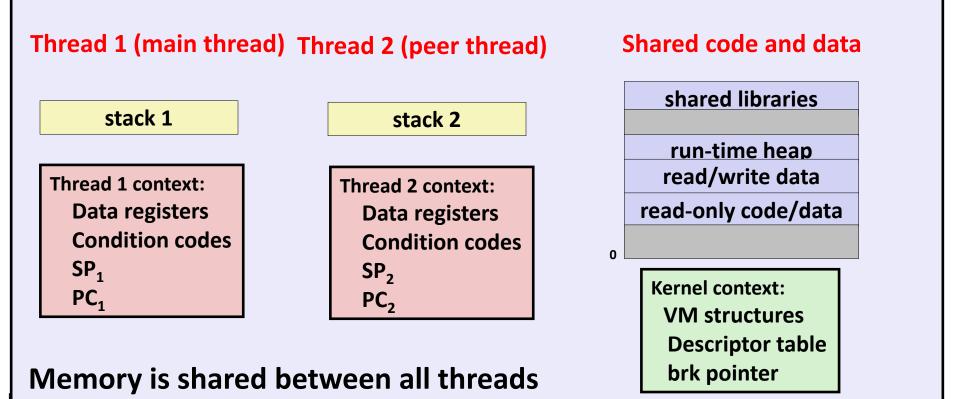

run-time heap read/write data

read-only code/data

Kernel context:

VM structures
Descriptor table
brk pointer

# Don't let picture confuse you!

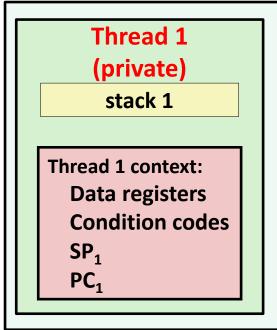

# **Shared Variables in Threaded C Programs**

- Question: Which variables in a threaded C program are shared?
  - The answer is not as simple as "global variables are shared" and "stack variables are private"
- Def: A variable x is shared if and only if multiple threads reference some instance of x.
- Requires answers to the following questions:
  - What is the memory model for threads?
  - How are instances of variables mapped to memory?
  - How many threads might reference each of these instances?

# **Threads Memory Model: Conceptual**

- Multiple threads run within the context of a single process
- Each thread has its own separate thread context
  - Thread ID, stack, stack pointer, PC, condition codes, and GP registers
- All threads share the remaining process context
  - Code, data, heap, and shared library segments of the process virtual address space
  - Open files and installed handlers

Thread 2
(private)
stack 2

Thread 2 context:
Data registers
Condition codes
SP<sub>2</sub>
PC<sub>2</sub>

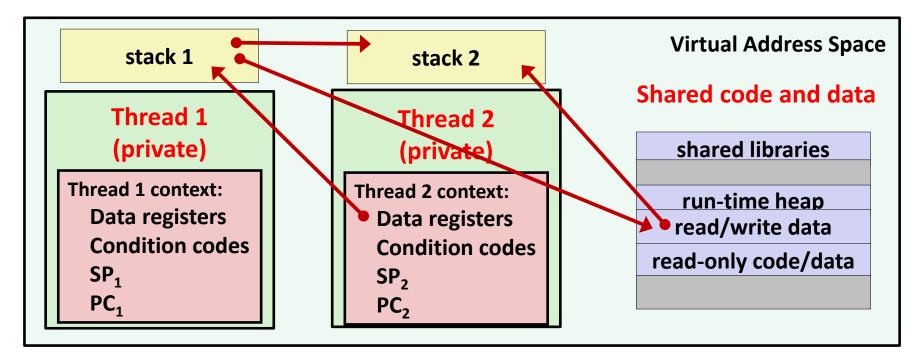

shared code and data

shared libraries

run-time heap
read/write data
read-only code/data

# **Threads Memory Model: Actual**

- Separation of data is not strictly enforced:
  - Register values are truly separate and protected, but...
  - Any thread can read and write the stack of any other thread

The mismatch between the conceptual and operation model is a source of confusion and errors

#### Passing an argument to a thread - Pedantic

```
int hist[N] = \{0\};
int main(int argc, char *argv[]) {
   long i;
  pthread t tids[N];
   for (i = 0; i < N; i++) {
      long* p = Malloc(sizeof(long));
      *p = i;
      Pthread create (&tids[i],
                      NULL,
                      thread,
                      (void *)p);
   for (i = 0; i < N; i++)
     Pthread join(tids[i], NULL);
   check();
```

```
void *thread(void *vargp)
{
    hist[*(long *)vargp] += 1;
    Free(vargp);
    return NULL;
}
```

```
void check(void) {
    for (int i=0; i<N; i++) {
        if (hist[i] != 1) {
            printf("Failed at %d\n", i);
            exit(-1);
        }
    }
    printf("OK\n");
}</pre>
```

### Passing an argument to a thread - Pedantic

```
int hist[N] = \{0\};
int main(int argc, char *argv[]) {
   long i;
  pthread t tids[N];
   for (i = 0; i < N; i++) {
      long* p = Malloc(sizeof(long));
      *p = i;
      Pthread create (&tids[i],
                      NULL,
                      thread,
                      (void *)p);
   for (i = 0; i < N; i++)
     Pthread join(tids[i], NULL);
   check();
```

```
void *thread(void *vargp)
{
    hist[*(long *)vargp] += 1;
    Free(vargp);
    return NULL;
}
```

- Use malloc to create a per thread heap allocated place in memory for the argument
- Remember to free in thread!
- Producer-consumer pattern

# Passing an argument to a thread - Also OK!

```
int hist[N] = \{0\};
int main(int argc, char *argv[]) {
   long i;
  pthread t tids[N];
   for (i = 0; i < N; i++)
     Pthread create(&tids[i],
                      NULL,
                      thread,
                      (void *)i);
   for (i = 0; i < N; i++)
     Pthread join(tids[i], NULL);
   check();
```

```
void *thread(void *vargp)
{
    hist[(long)vargp] += 1;
    return NULL;
}
```

- Use cast to since sizeof(long) <= sizeof(void\*)</li>
- Cast does NOT change bits

### Passing an argument to a thread - WRONG!

```
int hist[N] = \{0\};
int main(int argc, char *argv[]) {
   long i;
  pthread t tids[N];
   for (i = 0; i < N; i++)
     Pthread create(&tids[i],
                      NULL,
                      thread,
                      (void *)&i);
   for (i = 0; i < N; i++)
     Pthread join(tids[i], NULL);
   check();
```

```
void *thread(void *vargp)
{
    hist[*(long*)vargp] += 1;
    return NULL;
}
```

- &i points to same location for all threads!
- Creates a data race!

### **Example Program to Illustrate Sharing**

```
char **ptr; /* global var */
int main(int argc, char *argv[])
    long i;
    pthread t tid;
    char *msqs[2] = {
        "Hello from foo",
        "Hello from bar"
    };
   ptr = msqs;
    for (i = 0; i < 2; i++)
        Pthread create (&tid,
            NULL,
            thread,
            (void *)i); ←
    Pthread exit(NULL);
                            sharing.c
```

Peer threads reference main thread's stack indirectly through global ptr variable

A common way to pass a single argument to a thread routine

#### Compare three different ways to pass arg:

- Malloc/free
- Ptr to stack slot
- Cast of int

#### Static meaning

# **Mapping Variable Instances to Memory**

#### Global variables

- Def: Variable declared outside of a function
- Virtual memory contains exactly one instance of any global variable

#### Local variables

- Def: Variable declared inside function without static attribute
- Each thread stack contains one instance of each local variable

#### Local static variables

- Def: Variable declared inside function with the static attribute
- Virtual memory contains exactly one instance of any local static variable.

### Mapping Variable Instances to Memory

Global var: 1 instance (ptr [data])

```
Local vars: 1 instance (i.m, msgs.m, tid.m)
char **ptr; /* global var *
int main(int main, char *argv[])
    long i
    pthread t tid;
    char *msqs[2] = {
        "Hello from foo",
        "Hello from bar"
    };
    ptr = msqs;
    for (i = 0; i < 2; i++)</pre>
        Pthread create (&tid,
            NULL,
             thread,
             (void *)i);
    Pthread exit(NULL);
                            sharing.c
```

```
Local var: 2 instances (
  myid.p0 [peer thread 0's stack],
  myid.p1 [peer thread 1's stack]
void *thread(void *vargp)
    long myid = (long) varqp;
    static int cnt = 0;
    printf("[%ld]: %s (cnt=%d) \n",
         myid, ptr[myid], ++cnt);
    return NVLL;
```

Local static var: 1 instance (cnt [data])

### **Shared Variable Analysis**

Which variables are shared?

```
Variable Referenced by Referenced by
                                         Referenced by
instance main thread? peer thread 0? peer thread 1?
ptr
              yes
                             yes
                                              yes
cnt
              no
                             yes
                                              yes
i.m
              yes
                             no
                                              no
msgs.m
              ves
                             yes
                                              yes
myid.p0
              no
                             yes
                                              no
myid.p1
              no
                             no
                                              yes
```

### **Shared Variable Analysis**

Which variables are shared?

Variable instance	Referenced by main thread?	Referenced by peer thread 0?	Referenced by peer thread 1?
ptr	yes	yes	yes
cnt	no	yes	yes
i.m	yes	no	no
msgs.m	yes	yes	yes
myid.p0	no	yes	no
myid.p1	no	no	yes

- Answer: A variable x is shared iff multiple threads reference at least one instance of x. Thus:
  - ptr, cnt, and msgs are shared
  - i and myid are not shared

# **Synchronizing Threads**

- Shared variables are handy...
- ...but introduce the possibility of nasty synchronization errors.

#### badcnt.c: Improper Synchronization

```
/* Global shared variable */
volatile long cnt = 0; /* Counter */
int main(int argc, char **argv)
    long niters;
    pthread t tid1, tid2;
    niters = atoi(argv[1]);
    Pthread create (&tid1, NULL,
        thread, &niters);
    Pthread create (&tid2, NULL,
        thread, &niters);
    Pthread join(tid1, NULL);
    Pthread join(tid2, NULL);
    /* Check result */
    if (cnt != (2 * niters))
        printf("BOOM! cnt=%ld\n", cnt);
    else
        printf("OK cnt=%ld\n", cnt);
    exit(0);
                                 badcnt.c
```

```
linux> ./badcnt 10000
OK cnt=20000
linux> ./badcnt 10000
BOOM! cnt=13051
linux>
```

cnt should equal 20,000.

What went wrong?

### **Assembly Code for Counter Loop**

#### C code for counter loop in thread i

```
for (i = 0; i < niters; i++)
    cnt++;</pre>
```

#### Asm code for thread i

```
movq (%rdi), %rcx
    testq %rcx,%rcx
    ile .L2
    movl $0, %eax
.L3:
                               L_i: Load cnt
    movq cnt(%rip),%rdx
                               U<sub>i</sub>: Update cnt
    addq $1, %rdx
                               S_i: Store cnt
    movq %rdx, cnt(%rip)
    addq $1, %rax
    cmpq %rcx, %rax
                               T_i: Tail
           .L3
    jne
.L2:
```

#### **Concurrent Execution**

- Key idea: In general, any sequentially consistent interleaving is possible, but some give an unexpected result!
  - I<sub>i</sub> denotes that thread i executes instruction I
  - %rdx<sub>i</sub> is the content of %rdx in thread i's context

i (thread)	instr <sub>i</sub>	$ m \%rdx_1$	%rdx <sub>2</sub>	cnt
1	H <sub>1</sub>	-	-	0
1	L <sub>1</sub>	0	-	0
1	U <sub>1</sub>	1	-	0
1	S <sub>1</sub>	1	-	1
2	H <sub>2</sub>	-	-	1
2	L <sub>2</sub>	-	1	1
2	U <sub>2</sub>	-	2	1
2	$S_2$	-	2	2
2	T <sub>2</sub>	-	2	2
1	T <sub>1</sub>	1	-	2

OK

#### **Concurrent Execution**

- Key idea: In general, any sequentially consistent interleaving is possible, but some give an unexpected result!
  - I<sub>i</sub> denotes that thread i executes instruction I
  - %rdx<sub>i</sub> is the content of %rdx in thread i's context

i (thread)	instr <sub>i</sub>	$%$ rd $x_1$	%rdx <sub>2</sub>	cnt		
1	H <sub>1</sub>	-	-	0		Thread 1
1	L₁	0	-	0		critical section
1	$U_1$	1	-	0		critical section
1	S <sub>1</sub>	1	-	1		Thread 2
2	H <sub>2</sub>	-	-	1		critical section
2	$L_2$	-	1	1		
2	$U_2$	-	2	1		
2	<b>S</b> <sub>2</sub>	-	2	2		
2	T <sub>2</sub>	-	2	2		
1	$T_1$	1	-	2	OK	

# **Concurrent Execution (cont)**

Incorrect ordering: two threads increment the counter, but the result is 1 instead of 2

i (thread)	instr <sub>i</sub>	$%$ rd $x_1$	%rdx <sub>2</sub>	cnt
1	H <sub>1</sub>	-	-	0
1	L <sub>1</sub>	0	-	0
1	U <sub>1</sub>	1	-	0
2	H <sub>2</sub>	-	-	0
2	L <sub>2</sub>	-	0	0
1	S <sub>1</sub>	1	-	1
1	<b>T</b> <sub>1</sub>	1	-	1
2	U <sub>2</sub>	-	1	1
2	S <sub>2</sub>	-	1	1
2	T <sub>2</sub>	-	1	1

Oops!

### **Concurrent Execution (cont)**

How about this ordering?

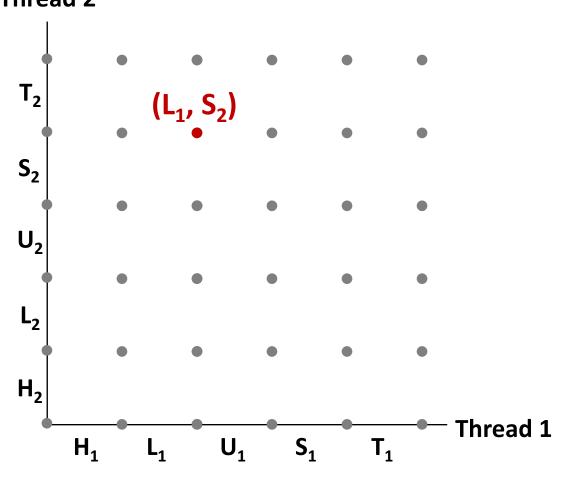

i (thread)	instr <sub>i</sub>	$%$ rd $x_1$	$%$ rd $x_2$	cnt
1	H <sub>1</sub>			0
1	L₁	0		
2	$H_2$			
2	L <sub>2</sub>		0	
2	U <sub>2</sub>		1	
2	S <sub>2</sub>		1	1
1	U <sub>1</sub>	1		
1	S <sub>1</sub>	1		1
1	T <sub>1</sub>			1
2	T <sub>2</sub>			1

Oops!

■ We can analyze the behavior using a *progress graph* 

### **Progress Graphs**

A progress graph depicts the discrete execution state space of concurrent threads.

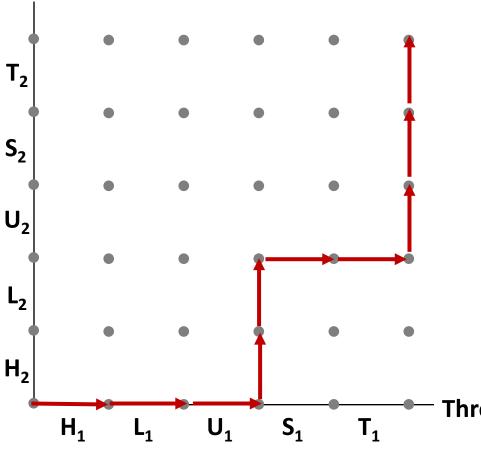

Each axis corresponds to the sequential order of instructions in a thread.

Each point corresponds to a possible *execution state* (Inst<sub>1</sub>, Inst<sub>2</sub>).

E.g., (L<sub>1</sub>, S<sub>2</sub>) denotes state where thread 1 has completed L<sub>1</sub> and thread 2 has completed S<sub>2</sub>.

### **Trajectories in Progress Graphs**

#### **Thread 2**

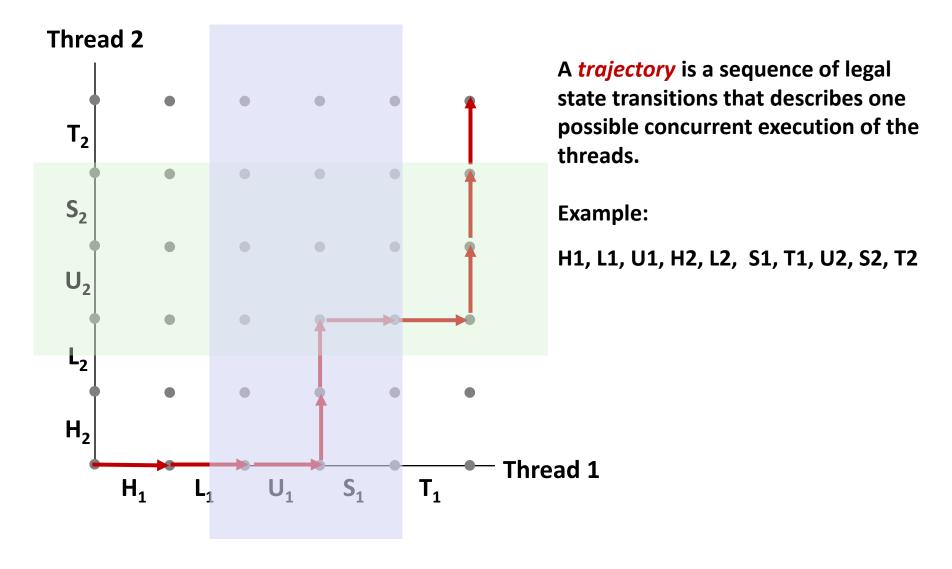

A *trajectory* is a sequence of legal state transitions that describes one possible concurrent execution of the threads.

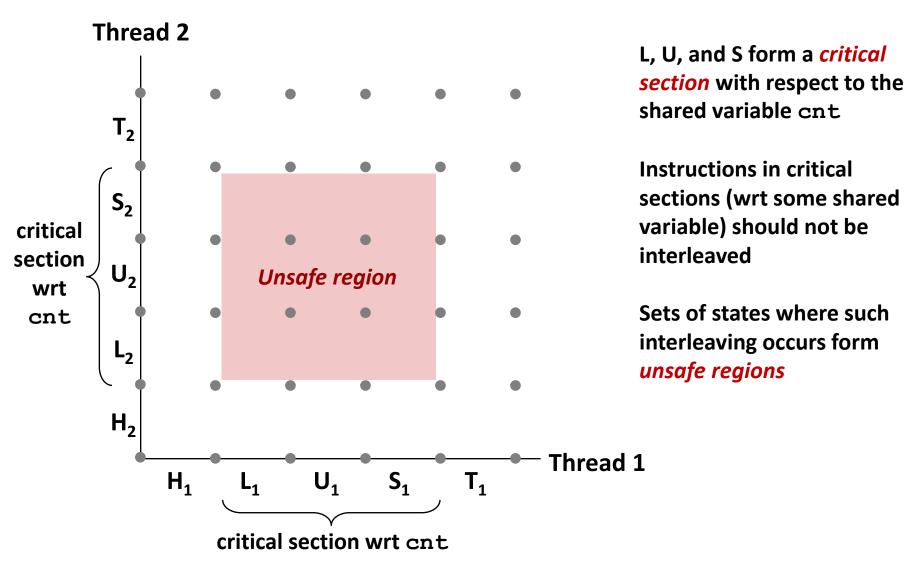

#### **Example:**

H1, L1, U1, H2, L2, S1, T1, U2, S2, T2

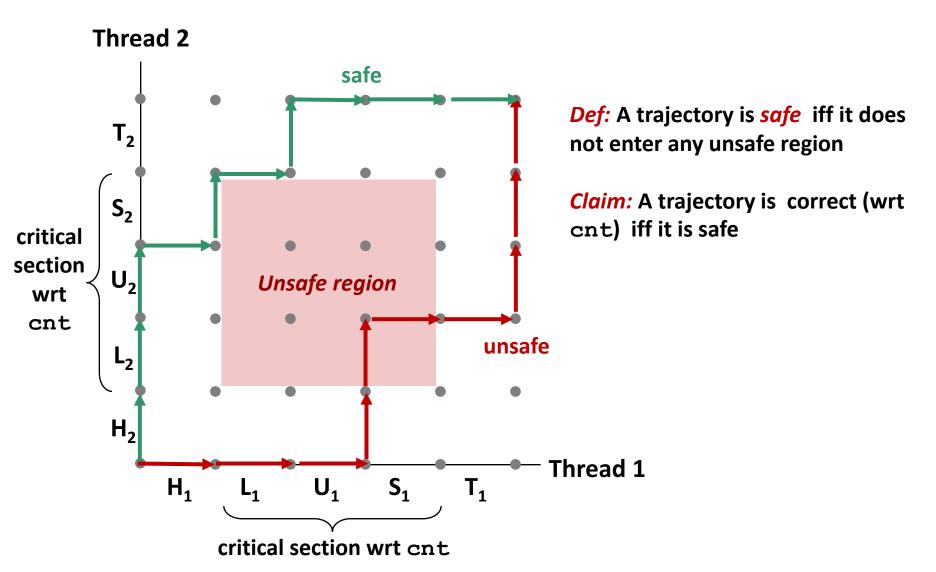

### **Trajectories in Progress Graphs**

#### **Critical Sections and Unsafe Regions**

#### **Critical Sections and Unsafe Regions**

# badcnt.c: Improper Synchronization

```
/* Global shared variable */
volatile long cnt = 0; /* Counter */
int main(int argc, char **argv)
    long niters;
    pthread t tid1, tid2;
    niters = atoi(argv[1]);
    Pthread create (&tid1, NULL,
        thread, &niters);
    Pthread create (&tid2, NULL,
        thread, &niters);
    Pthread join(tid1, NULL);
    Pthread join(tid2, NULL);
    /* Check result */
    if (cnt != (2 * niters))
        printf("BOOM! cnt=%ld\n", cnt);
    else
        printf("OK cnt=%ld\n", cnt);
    exit(0);
                                  badcnt.c
```

Variable	main	thread1	thread2			
cnt	yes*	yes	yes			
niters.m	yes	no	no			
tid1.m	yes	no	no			
i.1	no	yes	no			
i.2	no	no	yes			
niters.1	no	yes	no			
niters.2	no	no	yes

Quiz: day 24: Synchronization Basic

https://canvas.cmu.edu/courses/8555

#### **Enforcing Mutual Exclusion**

- Question: How can we guarantee a safe trajectory?
- Answer: We must synchronize the execution of the threads so that they can never have an unsafe trajectory.
  - i.e., need to guarantee mutually exclusive access for each critical section.
- Classic solution:
  - Semaphores (Edsger Dijkstra)
- Other approaches (out of our scope)
  - Mutex and condition variables (Pthreads)
  - Monitors (Java)

#### **Semaphores**

- Semaphore: non-negative global integer synchronization variable.
   Manipulated by P and V operations.
- **■** P(s)
  - If s is nonzero, then decrement s by 1 and return immediately.
    - Test and decrement operations occur atomically (indivisibly)
  - If s is zero, then suspend thread until s becomes nonzero and the thread is restarted by a V operation.
  - After restarting, the P operation decrements s and returns control to the caller.
- V(s):
  - Increment *s* by 1.
    - Increment operation occurs atomically
  - If there are any threads blocked in a P operation waiting for s to become non-zero, then restart exactly one of those threads, which then completes its P operation by decrementing s.
- Semaphore invariant: (s >= 0)

## Semaphores

- Semaphore: non-negative global integer synchronization variable
- Manipulated by P and V operations:
  - P(s): [ while (s == 0) wait(); s--; ]
    - Dutch for "Proberen" (test)
  - V(s): [ s++; ]
    - Dutch for "Verhogen" (increment)
- OS kernel guarantees that operations between brackets [] are executed indivisibly
  - Only one P or V operation at a time can modify s.
  - When while loop in P terminates, only that P can decrement s
- Semaphore invariant: (s >= 0)

# **C Semaphore Operations**

### **Pthreads functions:**

```
#include <semaphore.h>
int sem_init(sem_t *s, 0, unsigned int val);} /* s = val */
int sem_wait(sem_t *s); /* P(s) */
int sem_post(sem_t *s); /* V(s) */
```

### **CS:APP wrapper functions:**

```
#include "csapp.h"

void P(sem_t *s); /* Wrapper function for sem_wait */
void V(sem_t *s); /* Wrapper function for sem_post */
```

# badcnt.c: Improper Synchronization

```
/* Global shared variable */
volatile long cnt = 0; /* Counter */
int main(int argc, char **argv)
    long niters;
    pthread t tid1, tid2;
    niters = atoi(arqv[1]);
    Pthread create (&tid1, NULL,
        thread, &niters);
    Pthread create (&tid2, NULL,
        thread, &niters);
    Pthread join(tid1, NULL);
    Pthread join(tid2, NULL);
    /* Check result */
    if (cnt != (2 * niters))
        printf("BOOM! cnt=%ld\n", cnt);
    else
        printf("OK cnt=%ld\n", cnt);
    exit(0);
                                  badcnt.c
```

How can we fix this using semaphores?

# **Using Semaphores for Mutual Exclusion**

### Basic idea:

- Associate a unique semaphore mutex, initially 1, with each shared variable (or related set of shared variables).
- Surround corresponding critical sections with P(mutex) and V(mutex) operations.

### Terminology:

- Binary semaphore: semaphore whose value is always 0 or 1
- Mutex: binary semaphore used for mutual exclusion
  - P operation: "locking" the mutex
  - V operation: "unlocking" or "releasing" the mutex
  - "Holding" a mutex: locked and not yet unlocked.
- Counting semaphore: used as a counter for set of available resources.

## goodcnt.c: Proper Synchronization

Define and initialize a mutex for the shared variable cnt:

Surround critical section with P and V:

```
for (i = 0; i < niters; i++) {
    P(&mutex);
    cnt++;
    V(&mutex);
}
</pre>
```

```
linux> ./goodent 10000
OK cnt=20000
linux> ./goodent 10000
OK cnt=20000
linux>
```

Warning: It's orders of magnitude slower than badent.c.

### goodcnt.c: Proper Synchronization

Define and initialize a mutex for the shared variable cnt:

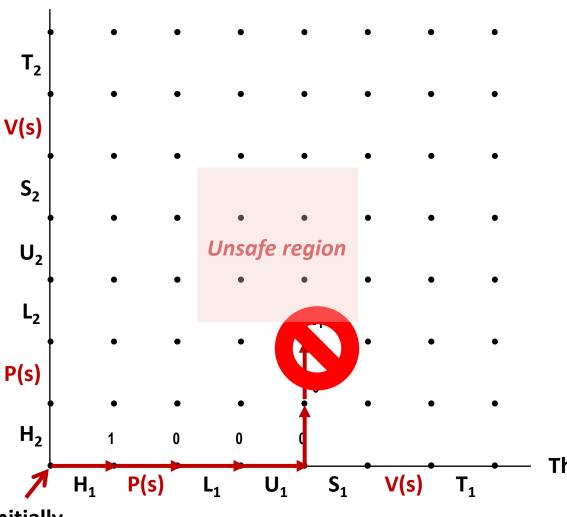

Surround critical section with P and V:

for (i = 0; i < niters; i++) {     P(&mutex);	
cnt++;	
V(&mutex);	ľ
<b>J</b>	

Function	badcnt	goodcnt
Time (ms) niters = 10 <sup>6</sup>	12.0	450.0
Slowdown	1.0	37.5

Warning: It's orders of magnitude slower than badent.c.

#### Thread 2

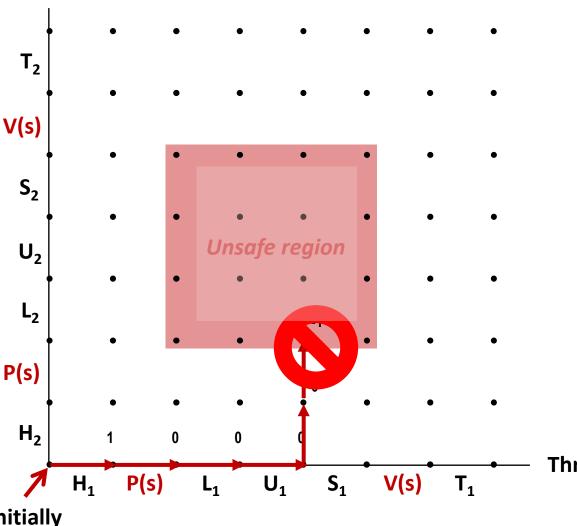

Provide mutually exclusive access to shared variable by surrounding critical section with *P* and *V* operations on semaphore s (initially set to 1)

Thread 1

Initially

**S = 1**Bryant and O'Hallaron, Computer Systems: A Programmer's Perspective, Third Edition

#### Thread 2

**Provide mutually exclusive** access to shared variable by surrounding critical section with P and V operations on semaphore s (initially set to 1)

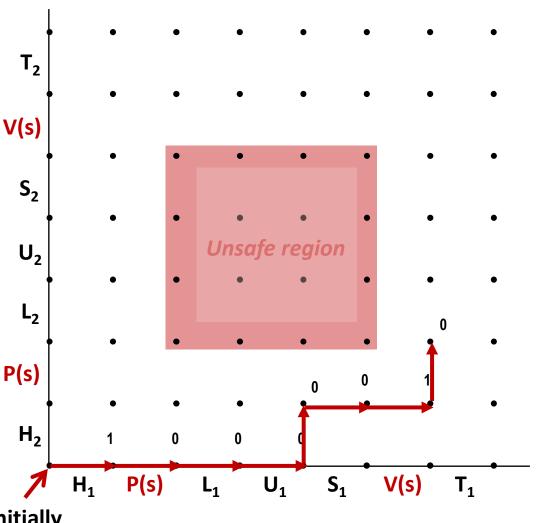

**Semaphore invariant** creates a forbidden region that encloses unsafe region and that cannot be entered by any trajectory.

Thread 1

Initially

**S = 1**Bryant and O'Hallaron, Computer Systems: A Programmer's Perspective, Third Edition

#### Thread 2

**Provide mutually exclusive** access to shared variable by surrounding critical section with P and V operations on semaphore s (initially set to 1)

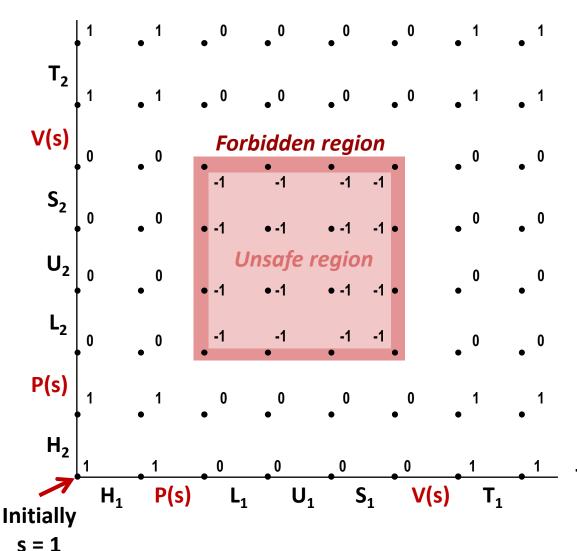

**Semaphore invariant** creates a forbidden region that encloses unsafe region and that cannot be entered by any trajectory.

Thread 1

Initially

**S = 1**Bryant and O'Hallaron, Computer Systems: A Programmer's Perspective, Third Edition

#### **Thread 2**

Provide mutually exclusive access to shared variable by surrounding critical section with *P* and *V* operations on semaphore s (initially set to 1)

Semaphore invariant creates a *forbidden region* that encloses unsafe region and that cannot be entered by any trajectory.

Thread 1

# **Binary Semaphores**

- Mutex is special case of semaphore
  - Value either 0 or 1
- Pthreads provides pthread\_mutex\_t
  - Operations: lock, unlock
- Recommended over general semaphores when appropriate

## goodmcnt.c: Mutex Synchronization

Define and initialize a mutex for the shared variable cnt:

```
volatile long cnt = 0; /* Counter */
pthread_mutex_t mutex;
pthread_mutex_init(&mutex, NULL); // No special attributes
```

### Surround critical section with *lock* and *unlock*:

```
for (i = 0; i < niters; i++) {
   pthread_mutex_lock(&mutex);
   cnt++;
   pthread_mutex_unlock(&mutex);</pre>
```

linux> ./goodmcnt	10000
OK cnt=20000

# Summary

- Programmers need a clear model of how variables are shared by threads.
- Variables shared by multiple threads must be protected to ensure mutually exclusive access.
- Semaphores are a fundamental mechanism for enforcing mutual exclusion.
